REMARKS IN SUPPORT OF  
THE PRE-APPEAL BRIEF REQUEST FOR REVIEW

Dear Sir:

In response to the Office Action mailed September 22, 2005 (hereinafter, "the Office Action") and further pursuant to the Notice of Appeal and Pre-Appeal Brief Request for Review submitted herewith, the Applicants respectfully request review and reconsideration of the Office Action in view of the following issues.

**The Office Action Bases Rejection of the Independent Claims On The Previously Cited Art**

The Applicants previously submitted a Pre-Appeal Request For Review on August 9, 2005 (hereinafter, "the First Request") in response to a Final Office Action (hereinafter, "the Final Action") dated May 10, 2005. In the Final Action, the Examiner rejected the independent claims 1, 10, 19, 23 and 26 under 35 U.S.C. § 103(a) over Cohen (US 6,477,595 B1). In the First Request, the Applicants showed that Cohen does not disclose each and every element of these independent claims, and in a Panel Decision dated September 22, 2005 prosecution of the Application was reopened. However, in the Office Action (sent with the Panel Decision) the independent claims were again rejected based on Cohen, although this time the rejection was premised under 35 U.S.C. § 102. Given that the Examiner has simply restated the same

## PATENT

arguments from the Final Action, Applicants do not believe it would be fruitful to submit a response to the Office Action, and instead have elected to proceed with this Request for Pre-Appeal Brief Request for review.

**Claims 1-6, 8-14, and 16-29 are allowable**

Claims 1-4, 6, 8-14, 16, 17, 19-26 and 29 were rejected under 35 U.S.C. § 102 over Cohen. Claim 1, from which claims 2-6 and 8-9 depend, recites the following element: "blocking logic responsive to detection logic, the blocking logic to selectively initiate a blocking signal to disable communications from the second interface from being sent over the first interface to the end-user computer." Although the Final Action on page 2 admits that Cohen does not expressly disclose this element, the Office Action states that this element is disclosed at column 10, line 65 through column 11, line 3 of Cohen. Applicants submit that the Office Action is incorrect. Cohen discloses a central office modem in a standby mode. Cohen fails to teach or suggest that the central office modem in standby mode blocks any communication to the end station through the customer premise DSL modem. If, for example, a communication is sent from a wide area network to an end user computer through the central office while the central office modem is in standby mode, there is no teaching or suggestion in Cohen that the central office modem will selectively initiate a blocking signal to block the communication from the wide area network to the end station. Accordingly, Cohen fails to disclose or suggest each and every element of claim 1.

Claim 10, from which claims 11-14 and 16-18 depend, recites a method including "blocking data originating from the second wide area data network connection from being communicated to the first local data connection to establish a blocking condition." As set forth above, Cohen does not teach or disclose blocking data communications from a wide area data network to an end-user computer. Accordingly, Cohen fails to disclose or suggest each and every element of claim 10.

Claim 19, from which claims 20-22 depend, recites a method including "during a first period of time, blocking data received from the second port of the digital subscriber line routing equipment from being communicated by the first port of the digital subscriber line routing equipment." As set forth above, Cohen does not teach or disclose blocking data communications

## PATENT

at routing equipment. Accordingly, Cohen fails to disclose or suggest each and every element of claim 19.

Claim 23, from which claims 24 and 25 depend, recites the following element "blocking logic responsive to the detection logic, the blocking logic to selectively initiate a blocking signal to selectively disable communications from being sent over the first interface to at least one of the plurality of end-user computers in the local area network while allowing communications to be sent over the first interface to at least one other of the plurality of end-user computers in the local area network." As set forth above, Cohen discloses a standby mode and does not suggest or disclose selectively initiating a blocking signal to selectively disable communications from being sent over the first interface to at least one of the plurality of end-user computers in the local area network while allowing communications to be sent over the first interface to at least one other of the plurality of end-user computers in the local area network. In contrast to claim 23, Cohen teaches a modem in standby mode that does not selectively initiate blocking signals to allow communications to be sent over a first interface to an end user computer. Accordingly, Cohen fails to disclose or suggest each and every element of claim 23.

Claim 26, from which claims 27-29 depend, recites a method that includes the following element "selectively blocking data originating from the wide area network data connection from being communicated to the one or more of the plurality of inactive end-user computers while allowing data originating from the wide area network data connection to be communicated to at least one of the plurality of the end-user computers that remains in an active state." As set forth above, Cohen does not disclose or suggest selectively blocking data originating from the wide area network data connection from being communicated to one or more of a plurality of inactive end-user computers while allowing data originating from the wide area network data connection to be communicated to at least one of the plurality of the end-user computers that remains in an active state. Accordingly, Cohen fails to disclose or suggest each and every element of claim 26.

With respect to claims 2-4, 6, 8, 9 11-14, 16, 17, 19-22, 24, 25 and 29, Cohen fails to teach each and every limitation of these claims, at least by virtue of their dependency from one of the independent claims 1, 10, 19, 23, and 26.

**PATENT****Claims 5, 18, and 27-28 are allowable**

Claims 5, 18, and 27-28 were rejected under 35 U.S.C. § 103(a) over Cohen in view of Evans (US 6,477,595 B1). As set forth above, Cohen fails to teach or suggest the specific combination of these claims, at least because of their dependency on claims 1, 10, and 26, respectively. Further, Evans does not remedy the deficiency of Cohen. Accordingly, Cohen and Evans, individually and in combination, fail to disclose or suggest each and every element of claims 5, 18, and 27-28, at least by virtue of their dependency on the independent claims 1, 10, and 26 respectively.

**Claims 7, 15 and 30 are allowable**

Claims 7, 15 and 30 were rejected under 35 U.S.C. § 103(a) over Cohen in view of Gerszberg (US 6,510,152 B1). As set forth above, Cohen fails to teach or suggest the specific combination of these claims, at least because of their dependency on claims 1, 10, and 26, respectively. Further, the specific combination of these claims are not shown by the combination of Cohen and Gerszberg.

Furthermore, there is no suggestion in either Cohen or Gerszberg that the references be combined. In particular, Gerszberg discloses a “set-top box” to allow an interexchange carrier to access telephone lines or cable lines before those lines enter the switching technology of local telephone carriers. Gerszberg, col. 2 lines 27-43. Gerszberg does not address the blocking of data to an end user computer from a wide area network. Furthermore, Gerszberg does not address and is not related to the area of multiplexing multiple DSL modems, as described by the Cohen patent. Accordingly, there is no motivation, teaching or suggestion for one of skill in the art to combine the Cohen and Gerszberg references.

**Conclusion**

As discussed above, the Office Action fails to establish that the cited references and the proposed combinations thereof disclose or suggest the specific combinations of elements recited by independent claims 1, 10, 19, 23, and 26. The Office Action therefore fails to establish that the cited references disclose or suggest each and every element of claims 2-9, 11-18, 20-21, 24-25, and 27-30 at least by virtue of their dependency from one of claims 1, 10, 19, 23, or 26.

## PATENT

Accordingly, the pending claims are allowable over the cited references and the Applicants therefore request withdrawal of all pending rejections.

Respectfully submitted,

12/19/05
